Abstract (en)

A pneumatic device is provided which comprises: an inlet port for receiving compressed gas from an exhaust of a diaphragm pump; an external outlet port for outputting compressing gas to a further pneumatic device; an internal chamber defined by an internal housing arranged to funnel received compressed gas towards an internal outlet port of the internal chamber, the internal outlet port being located adjacent to, and spaced from, the external outlet port; and one or more exhausts positioned to exhaust compressed gas, from the pneumatic device, that is output from the internal outlet port without being output from the external outlet port. The pneumatic device may further comprise: a Venturi conduit for increasing the velocity of the compressed gas received by the inlet port; and one or more impellers arranged to drive compressed gas output by the Venturi conduit towards the external outlet port.
