Abstract (en)

[origin: WO2018025123A1] Lock (30) for doors and/or windows, comprising a box body (31) and at least a closing element (33) housed inside the box body (31) and mobile at least between an extracted configuration from the box body (31) and a retracted configuration in the box body (31). An actuator member (35) is kinematically connected to the closing element (33) for activating a displacement thereof between the extracted and retracted configurations, said actuator member (35) being mobile in rotation between at least two operating positions which respectively correspond to the above-said configurations of the closing element. The lock (30) further comprises a control member (37) kinematically connected to the actuator member (35) for controlling rotation thereof. The control member (37) is mobile along a translation direction between at least two operating positions which respectively correspond to the operating positions of the actuator member (35), which in turn correspond to the extracted and retracted configurations of the closing element (33).
