Abstract (en)

[origin: WO2017198727A1] The invention relates to a winding device (100) for winding up web-shaped materials (101) comprising at least one winding core on which the web-shaped material can be wound to form at least one winding (103), and comprising a transport roller, in particular a contact roller (102) via which the web-shaped material (101) can be guided, wherein the transport roller is arranged directly in front of the at least one winding core along the transport path of the web-shaped material (101) and, in particular, is in contact with the winding core or the winding (103). At least one roller (120, 306) is provided having a surface which can be applied with an application force at the edge of the web-shaped material on the winding (103).
