Abstract (en)

[origin: WO2017198931A1] The lighting system (1) comprises a light source (2) comprising at least one light-emitting diode (3) and a scanning device (5A) receiving the light radiation (R) generated by the light source (2), the scanning device (5A) comprising at least one rotatably mobile reflection system (6A) and a unit (7A) for moving the reflection system (6A), the light source (2) being configured so that a generally substantially rectangular light beam (F), oriented along a first direction, is emitted, the scanning device (5A) scanning the generally substantially rectangular light beam along a second direction, substantially orthogonal to said first direction, the scanning being carried out at a speed making it possible to benefit from a persistence of vision, and an activation/deactivation control of the light source (2) being synchronised with the scanning of the scanning device (5A).
