Abstract (en)

[origin: WO2017198334A1] The present invention relates to a process of detecting at least one molecule of interest in a sample, comprising the steps of: i) putting the sample in contact with a ligand that is specific to this molecule of interest and that is coupled with a fluorochrome consisting of phycoerythrin or one of its derivatives, ii) excitation of the mixture from step i) by at least one light source with a wavelength between 330 and 425 nm, iii) detecting an emission of light by the mixture following step ii) at a wavelength greater than or equal to 550 nm, and iv) determining whether the molecule of interest is present in the sample in view of the results of step iii).
