Abstract (en)  
[origin: CN109592573A] A crane is provided. The crane is movable by means of a matching traveling mechanism arrangement, in which a crane module without a traveling mechanism is provided; the crane module includes a machinebody that receives a telescopic cantilever and includes a laterally displayable support beam equipped with a support leg at an end thereof, and the crane module is provided with butt joint elements and thereby can be tipping-proofed docked to the traveling mechanism arrangement provided with mating insertion elements. Multiple usability can be achieved in a simple way, that is, the crane module is provided with the butt joint element on a longitudinal side and a transverse side thereof, and a traveling mechanism assembly equipped with mating insert elements and capable of being manipulated by means of the cantilever in the crane module supported by the support beam thereof may be coupled to the butt joint elements, wherein the traveling mechanism assembly is configured as a replacement assembly which can be optionally used for a defined purpose of use.
