Abstract (en)

An apparatus (2) for detecting freezing of a substance (3) includes a conduit (4) containing a substance (3) having a freezing temperature below which the substance (3) is in a solid state and above which the substance (3) is in a liquid state. The apparatus (2) also includes a layer (9) that is permeable to the substance (3) in its liquid state. The conduit (4) is arranged to convey the substance (3) to the layer (9). The apparatus (2) also includes a flow meter (6) constructed and arranged to obtain a measure of the flow rate of the substance (3) through the layer (9), whereby the flow rate of the substance (3) through the layer (9) detected by the flow meter (6) varies depending on the degree of freezing of the substance (3) on or in the layer (9).
