Abstract (en)

[origin: WO2017204985A1] A sole structure includes an insole with a sensory feedback system. The insole includes a first insole layer and a second insole layer coupled to the second insole layer, and the sensory feedback system includes multiple protrusions extending from the second insole layer and through the second insole layer. The protrusions are made from a material that is harder than the material forming the first insole layer. In other words, the hardness of the material forming the protrusions is greater than the hardness of the material forming the first insole layer. The protrusions are placed along a predetermined feedback region of the insole based on the user's needs. As such, the protrusions can provide the user a tactile sensory feedback to the user during golf swing.
