Abstract (en)
[origin: WO2017207085A1] The invention relates to a sub-frame (6) for fastening a rail loading crane (8) designed for transporting rails (7), which sub-frame consists of two longitudinal spars (11) extending parallel to one another and of two transverse spars (13) extending in a normal direction with respect thereto in a frame plane (12), said spars forming a main frame (10), which is divided into a first and a second frame portion (15, 16) by a central support (14) extending parallel to the transverse spars and arranged between them. Guides (20) for displaceably supporting a mass balancing plate (17) and a crane mounting plate (18) provided for fastening the loading crane (8) are associated with each frame section (15,16).
