Abstract (en)

[origin: CA3025412A1] The invention relates to a system for dispensing liquid from a tanker which has multiple chambers with at least one respective bottom valve. Each the bottom valves is connected to a collector via a respective connection line and a respective collector valve, and the collector is connected to at least one dispensing valve via at least one dispensing line. The collector additionally has a degassing device, and at least two flow cross-sections of different sizes can be released by the collector valves. A controller is provided which first opens the collector valve connected to the bottom valve of a chamber with a smaller flow cross-section in order to dispense liquid from said chamber and which then opens the collector valve with a larger flow cross-section. The invention additionally relates to a corresponding method.
