Abstract (en)

[origin: WO2017203043A1] The invention relates to a method for providing an edge strip along at least one edge face of a door, wherein a mold cavity is formed alongside said edge face, such that said edge face forms a side of the mold cavity, introducing a curable composition into said mold cavity, against the edge face and allowing the composition to cure inside the mold cavity, thereby attaching itself to said edge face and removing the door with the cured composition, wherein the cured composition forms a edge strip along said edge face.
