Abstract (en)

[origin: WO2017203146A1] The invention relates to a security method implemented by an electronic device (CD), the method comprising: determining a current point in time during which a current transaction is being implemented; selecting, in an archive file (LG) in which at least one past transaction is recorded, each transaction implemented by said electronic device (CD) in a predefined period of time ending at the current point in time; a risk analysis, based on at least one item of archive data recorded in the archive file in association with each transaction selected, in order to detect whether an anomalous use of the electronic device (CD) occurred during said predefined time period; and, if so, triggering at least one security operation of the electronic device (CD) in response to the current transaction.
