Abstract (en)

[origin: WO2017211696A1] A contacting device (1) for contacting a shielding conductor (20) of an electrical line (2) with a grounding section (3) comprises a housing (10) enclosing a receptacle space (14), into which an electrical line (2) having a shielding conductor (20) is insertable, wherein the housing (10) is attachable to a grounding section (3) in such a way that the grounding section (3) extends in the receptacle space (14). In addition, a spring element (11) arranged on the housing (10) pivotably about a pivoting axis (S) is provided, which spring element is pivotable from an opening position into a clamping position in order, in the clamping position, to contact a shielding conductor (20) of an electrical line (2) inserted into the receptacle space (14) with a grounding section (3) to which the housing (10) is attached. In this way, a contacting device is provided which enables reliable and durable contacting of a shielding conductor of an electrical line with a grounding section, for example of a busbar or a housing edge of an electrical installation (e.g. a switchgear cabinet), at the same time is simple to operate and, under certain circumstances, is also re-releasable from a clamping position.
