Abstract (en)
[origin: US2019105214A1] A support device, comprising a frame; a resting structure for a human body wherein the resting structure is pivotably attached at the frame and includes support elements configured to support a torso of the human body at the resting structure and a footrest; a pivot drive configured to pivot the resting structure at the frame about a transversal axis of the body between a prone position where a longitudinal axis of the body is parallel to a horizontal and a support position where the longitudinal axis of the body is inclined relative to the horizontal by a support angle wherein legs of the body support a weight of the body at least partially on the footrest; and an oscillation drive configured to induce an oscillation of the resting structure wherein the oscillation drive is supported at the frame and moves the resting structure parallel to the longitudinal axis.
