Abstract (en)
[origin: WO2017211850A1] The invention proposes a device (1) and the use thereof for dispensing a fluid, in particular under aseptic conditions. Said device (1) comprises a conveying device (2) and a container (3) with a variable inner volume. The conveying device (2) comprises a cylinder (4) with at least three openings (5, 6, 7) which are arranged in a row along a longitudinal central axis (11) and through which the fluid can be conveyed. The conveying device (2) moreover comprises a first and a second piston (9, 10). The first and the second piston (9, 10) are arranged in the cylinder (4) in such a way as to be displaceable along the longitudinal central axis and, between their end faces (11, 12), they delimit a variable fluid volume (14) together with a portion of the inner wall (13) of the cylinder. The first opening (5) can be brought into fluidic communication with a dispensing opening (15) of the device (1), and the second opening (6) can be brought into fluidic communication with the container (3). The first and the second piston (9, 10) each comprise at least three seals (16, 16', 16'') which are offset in the longitudinal direction and which close off the cylinder (4) sealingly. Adjacent seals (16, 16' or 16', 16'') on a piston (9, 10) have an inner spacing d_i which is at most equal to the shortest spacing a_{A1} between two adjacent openings (5, 6 or 6, 7).
