Abstract (en)
[origin: WO2017212176A1] The present invention relates to a method for manufacturing a package composed of two cardboard bases and a window extending on the lateral faces between said cardboard bases; cardboard cutouts (2) are prepared by cutting out, from a sheet, two parts (100, 200) which correspond respectively to the shape of the first and the second cardboard base joined together by separable connecting zones (160); the cutouts (2) are placed on a conveyor belt; pressing rollers are applied to the cutouts (2); one of the rollers in contact with one of the parts (200) is slowed down with respect to the roller in contact with the other part (100) in order to cause tearing of said separable zones (160); the two parts (100, 200) are repositioned by moving them apart by a distance corresponding to the height of the window (300); the window (300) is deposited in order to bond the edges on the corresponding edges of the parts (100, 200) which are thus repositioned. It also relates to equipment for carrying out the method and to a box produced according to this method.
