Abstract (en)  
[origin: WO2017212183A1] The invention relates to a device (10) for dispensing a fluid product, comprising a rigid cylindrical body (12) having a vertical main axis, a rigid piston (14) which is oriented essentially horizontally and which can slide vertically inside the body (12), and an upper extraction wall (24) which closes the upper end of the body (12). According to the invention, the body (12), the piston (14) and the upper wall (24) define a space (26) that is intended to be filled with the product to be dispensed. In addition, the upper wall (24) comprises a slotted cover (28) that can open in order to connect the space (26) to the exterior. The device is characterised in that the upper wall (24) is elastically deformable and can deform into the space (26) when a pressure is exerted manually on the upper wall (24), so as to increase the pressure inside the space (26) and cause the slotted cover (28) to open.
