Abstract (en)

[origin: WO2017216126A1] The invention relates to a broadband electrodynamic transducer (10) for headphones, said transducer (10) comprising:
- a magnetic motor (11) designed to generate a magnetic field; - a coil (12) that is disposed in the air gap (13) of the magnetic motor (11) and can move translationally under the effect of the magnetic field; and - a membrane (14) that is connected to the coil (12) in such a way as to convert the translational movement of the coil (12) into an acoustic wave; - the transducer (10) comprising a self-supporting coil (12) that is glued to the membrane (14), the membrane (14) having a Young's modulus of more than 40 GPa.
