Abstract (en)

[origin: CN109659193A] The present invention relates to an assembly comprising a modular electrical apparatus and an auxiliary module adapted to be associated with said apparatus on a mounting rail, said electrical apparatus being housed in a parallelepiped housing and having on one of its faces, a set of terminals said upstream, and on a face opposite to the previous relative to the rail, a set of terminals said downstream. This assembly is characterized in that the aforesaid housing said first (3) comprises a recess (i) able to receive the aforementioned auxiliary module (2) or a piece forming a hubcap having substantially the same footprint as the aforementioned auxiliary (2), and in that one (5) of the sets of terminals, said first, comprises terminals having a pitch corresponding to that a standard comb and extends over substantially the entire width of the device (1), while the other (6) of the two sets of terminals (5,6), said second, has terminals A step reduced with respect to the above and extends over only a part of the width of the electrical apparatus (1), so that the association of this auxiliary module (2) to the aforementioned electrical device (1), does not increase the size of the device with which it is associated, and allows the electrical connection of the terminals of said first set (5) of terminals to a standard comb.
