Abstract (en)

[origin: WO2017215693A1] The invention relates to a measured value change sensing device for sensing measured value changes at a location of use (4), having at least one electrically conductive element (1), characterized in that, with respect to properties sensing the measured value changes or at least transmitting the measuring value changes, the electrically conductive element (1) is configured to produce intrinsic properties of the electrically conductive element (1) at the location of use (4), wherein the electrically conductive element (1) is connected directly to the location of use (4), and therefore the configuration of the electrically conductive element (1) depends on the configuration of the location of use (4).
