Abstract (en)

[origin: WO2017220465A1] In order to make it possible to test a monitoring device with travelling wave capture in the field, as are also installed in real operation, provision is made for the temporal profile of a low-frequency fault voltage (UF(t)) and/or the temporal profile of a low-frequency fault current (IF(t)) of a fault (F) on a current conductor (3) and the time (tA, tB) at which a travelling wave (W) starting from the fault location (F) arrives at a predetermined location (x, L-x) of the current conductor (3) to be calculated in the testing device (10), and for a voltage amplifier (14) for generating the temporal profile of the low-frequency fault voltage (UF(t)) and/or a current amplifier (15) for generating the temporal profile of the low-frequency fault current (IF(t)) to be controlled by a control unit (11) in the testing device (10) in order to output the low-frequency fault voltage (UF(t)) at a voltage output of the testing device (10) and/or the low-frequency fault current (IF(t)) at a current output of the testing device (10), and for a voltage pulse generator (16) for generating a voltage pulse and/or a current pulse generator (17) for generating a current pulse to be controlled by the control unit (11) at the calculated time (tA, tB) of the arrival of the travelling wave (W) in order to superimpose a voltage pulse on the fault voltage (UF(t)) and/or to superimpose a current pulse on the fault current (IF(t)).
