Abstract (en)

[origin: WO2017216460A1] The invention relates to control means suitable for being deployed in an industrial system comprising functional elements intended for implementing processes, at least one of the functional elements being a remote surveillance and data acquisition system. The control means comprising a module for determining a developed context configured for: • obtaining a first set of operating contexts of the industrial system; • collecting information relating: o to the mode of operation of each functional element of the industrial system at a time t; and/or, o to the functional state of each functional element of the industrial system at a time t; and/or, o to persons capable of interacting with each functional element of the industrial system at a time t; and/or, o to the functional states of elements constituting said at least one remote surveillance and data acquisition system at a time t; • determining, as a function of the collected information and of the first set, a developed operating context for the time t; • transmitting the developed operating context for the time t to: o a processing module capable of detecting an anomaly in the function of said developed context; and/or, o a user interface suitable for generating a representation of said developed context.
