Abstract (en)
[origin: WO2018072940A1] The invention relates to a plug-in connection (1), comprising a first electrical connector (2) and a second electrical connector (3), which can be plugged together in order to establish a mechanical and electrical connection. In order to support the connection of the electrical connectors (2, 3), an additional connecting device (5) is arranged on a housing (2.1) of the first electrical connector (2). The connecting device (5) has at least one first slotted-guide part (6), and a housing (3.1) of the second electrical connector (3) has at least one second slotted-guide part (7), which together form a slotted guide. The two slotted-guide parts (6, 7) of the slotted guide are arranged and designed in such a way that the two slotted-guide parts (6, 7) assume a first position relative to each other when the electrical connectors (2, 3) are plugged together into a preliminary latching position. The connecting device (5) is connected to the housing (2.1) of the first electrical connector (2) by means of at least one guide (9). The electrical connectors (2, 3) are mechanically coupled by means of the guide (9) and the slotted guide in such a way that the electrical connectors (2, 3) are plugged together into a final position when the two slotted-guide parts (6, 7) are in a second position relative to each other. The connecting device (5) can be slid with the first slotted-guide part (6) relative to the housing (2.1) of the first electrical connector (2) along the guide (9) from an unlocking position into a locking position in order to slide the two slotted-guide parts (6, 7) into the second position.
