Abstract (en)  
The present invention relates to modifications introduced in the mechanism for sealing, and subsequent opening and closing of recipients, more specifically to food recipients consisting of a container (C) and respective lid (T). The lid (T) consists of: tamper-evident band (T.1), opening tab (T.2), fitting fillets of the lid (T.3), inner skirt (T.4) and outer skirt (T.5). The container (C) consists of: bottom ring (C.1), upper ring (C.2) and fitting fillets in the container (C.3). This mechanism allows the initial closure and respective sealing of the recipient to be effected by pressure, being subsequently opened and closed by rotation of the lid (T).
