Abstract (en)  
[origin: EP3477798A1] An assembly system, includes: an assembly mechanism comprising a fixation device for fixing a housing and a first lead assembly mechanism and a second lead assembly mechanism provided at both sides of the fixation device, respectively, wherein the first lead assembly mechanism is adapted to insert a first lead into the housing, the second lead assembly mechanism is adapted to insert a second lead into the housing, and the first lead is inserted into the housing before the second lead. The assembly system further comprises a pressing mechanism adapted to hold the first lead inserted into the housing at a correct installation position, so as to prevent the first lead from being offset from its correct installation position and hindering operation of inserting the second lead during inserting the second lead. The assembly system may automatically complete the task of assembling the first lead and the second lead into the housing, improving the efficiency of inserting the leads into the housing, and increasing the quality of the assembly product.
