Abstract (en)
[origin: WO2018001602A1] The invention relates to a method and an arrangement for monitoring a battery in a motor vehicle. In the method, a first module (180) determines operating parameters of the battery. Variables, which represent the operating parameters, are compared with a load capacity model in order to determine in this way reliability variables of the battery, so that a future behavior of the battery can be predicted.
