Abstract (en)
[origin: WO2018050398A1] An automated teller machine (1) for paying in and/or paying out cash is disclosed, having: a housing (100) that has an opening (102) facing a front (V) of the automated teller machine (1), a module (30) that is mobile between a first position (P301), in which it is arranged directly adjacent to the opening (102), and a second position (P302), in which it is accessible from a rear (R) of the automated teller machine (1), and a security device (50) for sealing and unsealing the opening (102), which has the following: a sealing element (500) that is mobile between a first position (P5001), in which it unseals the opening (102), and a second position (P5002), in which it completely seals the opening (102), a coupling device (502) that is set up to transfer a reverse movement of the module (30) from its first position (P301) in the direction (A) of its second position (P302) to the sealing element (500) such that the latter moves from its first position (P5001) to its second position (P5002), and a blocking device (504) that has a blocked position, in which it blocks a forward movement of the module in the direction (E) of its first position (P301) until the module (30), in its reverse movement, has reached a third position (P303) situated between its first position (P301) and second position (P302), and an enabled position, in which it enables the forward movement of the module (30) from its third position (P303) in the direction of its first position (P301), the sealing element (500) being in its second position (P5002) in the third position (P303) of the module (30).
