Abstract (en)

The invention is directed to a moving device for moving manoeuvring or closing members of a window or door of the type controlled by rotation of the pin of a control handle. Said moving device comprises i.a. a rotating element which is housed in a supporting and holding body. The rotating element comprises a hollow seat coaxial with the axis of rotation of the rotating element. The hollow seat comprises a first and a second axial section. The first axial section is shaped to be coupled with a corresponding section of a pin of a control handle. The second axial section is distinct from the first axial section. Furthermore, the rotating element comprises locking means which are arranged in the second axial section for removably locking the axial sliding of the pin, wherein the axial sliding of the pin into the hollow seat is allowed in the direction of insertion and prevented in the opposite direction.
