Abstract (en)  
[origin: CA3030060A1] The invention relates to a formwork element (20a) of a ceiling formwork (10). The formwork element (20a) has a non-fully circumferentially closed, in particular U-shaped, frame onto which a formwork skin can be or is arranged. The frame preferably has at least a first leg, a second leg and a base strut in between. The base strut is preferably oriented at a right angle  $\pm 5^\circ$  relative to the two legs. The legs are preferably each provided at their end regions opposite to the base strut with a fastening projection and/or a fastening recess. The formwork element (20a) can be suspended by a worker from below into a pillar head (16a) and is upwardly pivotable. It makes it possible to build around an obstacle (18) in a simple manner while maintaining a grid-like imprint structure in the concrete surface to be created with the ceiling formwork (10).
