Abstract (en)  
[origin: WO2019063148A1] The invention relates to an electric contact device for electrically connecting a first component to a second component. The electric contact device of the invention includes an outer conductor, at least one inner conductor inside the outer conductor, and a first elastic element between the outer conductor and the at least one inner conductor. The outer conductor and the at least one inner conductor are each connected to the first component and the second component or can be brought into contact therewith. The axial dimension of the at least one inner conductor and of the outer conductor can be modified. The outer conductor and the at least one inner conductor are metallic. The first elastic element is made of an electrically insulating material and is attached to the outer conductor.
