Abstract (en)
[origin: WO2018010859A1] The invention relates to a stackable system container (1) having a base part (2) and having a cover part (3) fastened to the base part (2), and having at least two coupling elements (9a, 9b) which protrude upward beyond a top side (7) of the system container (1) and which each have at least one recess (10a, 10b) for the engagement of a coupling device (11a; 11b) of an identical system container (1) arranged thereabove and which are arranged at opposite ends of the top side (7) of the system container (1). To permit both dimensionally stable and connected stacking of structurally identical system containers and also modular stacking of different system containers, the coupling elements (9a, 9b) are fastened pivotably to the top side (7) of the system container (1) such that, in a pivoted-in position, they do not protrude beyond the top side (7) of the system container.
