Abstract (en)
[origin: WO2018010858A1] The invention relates to a stackable system container (1) having a base part (2), wherein a respective coupling device (7) for connection to a further system container is fastened on two opposite side walls (6) of the base part (2) such that it can be moved between a rest position, in which the coupling device (7) can be disengaged from a further system container, and a coupling position, in which the coupling device (7) can be engaged with the further system container. In order to provide for structurally identical system containers to be stacked optionally in a dimensionally stable, interconnected manner or separately, and therefore such that they can easily be singulated, each coupling device (7) is assigned a locking element (9), which arrests the respective coupling device (7) releasably in the rest position.
