Abstract (en)  
[origin: WO2018010737A2] The invention relates to a scaling ramp (1) for escalading objects that are higher than a base surface. Said ramp (1) comprises at least one narrow bridge (2) which is adjoined at opposite ends by a foot part (3) to be supported by the base surface and a head part (4) for securing it to the higher object, and a circulation area (5) between the foot part (3) and the head part (4) on which individuals attain, when the narrow bridge (2) is in the operational position with foot part (3) and head part (4), an access opening of the object by walking in a direction that extends in the longitudinal direction of the narrow bridge (2). The technical solution described in the invention is characterized in that the head part (4) has at least one unit (6) for breaking and/or pushing in glass and a hook element (7) which, in the operational position in which the foot part (3) is supported by the base surface and the head part (4) is secured to the object, at least partially surrounds a structural component of the object.
