Abstract (en)

[origin: WO2018050479A1] The invention relates to the monitoring of a rail vehicle in an ETCS safety system, in which the rail vehicle is assigned a protected area by the radio block centre if a radio block centre is no longer able to verify the integrity of the rail vehicle. It is advantageous in this case that the rail vehicle can also be monitored fully in the ETCS Level 3 safety system, and hazards on the line can be efficiently prevented.
