Abstract (en)

[origin: WO2018015096A1] The invention relates to a firearm (100, 200) and to a method for improving the accuracy that can be achieved with the firearm (100, 200) in firing at a target (5, 105) that is moving transversely to the firing direction with a horizontal motion component, wherein a sighting line (4, 104) is directed at the target (5, 105), wherein, in the event of a movement (P) of the firearm (100, 200) in a horizontal plane, in particular in the event of pivoting in a horizontal plane, the course of the sighting line (4, 104) is changed by a presettable angular magnitude against the direction of motion (P).
