Abstract (en)
The propulsive mono-fin of the invention for swimming consists of two independent parts, one of them a polyethylene plate and the other a cover. In this way, the plate has a "Y"-shaped configuration, delimited by two end forks and a central stem with rounded edges, while the neoprene casing presents an opening for the insertion of the central stem of the plate inside it. The cover is furnished with a pair of holes for inserting and fastening the swimmer's feet and the plate includes a perimeter covering of a higher-strength material than that of the plate itself. Also, the cover includes means of closure via which the plate is embraced so that the end forks of the plate protrude sideways from the cover.
