Abstract (en)

[origin: WO2018034952A1] A corona igniter (20) comprises a central electrode (22) surrounded by an insulator (26), which is surrounded by a conductive component. The conductive component includes a shell (34) and an intermediate part (36) both formed of an electrically conductive material. The intermediate part is a layer of metal which brazes the insulator to the shell. An outer surface (50) of the insulator presents a lower ledge (52), and the layer of metal can be applied to the insulator above the lower ledge prior to or after inserting the insulator into the shell. The conductive inner diameter D_c is less than an insulator outer diameter D_{io} directly below the lower ledge such the insulator thickness t_i increases toward the electrode firing end (40). The insulator outer diameter is also typically less than the shell inner diameter D_{is} also that the corona igniter can be reverse-assembled.
