Abstract (en)
[origin: CA3038348A1] The invention relates to a device (1) for applying a transferable substance (3) in stick form, having a substance carrier (17) and a protective sheath (18) for the substance carrier (17), wherein the substance carrier (17) can be shifted relative to the protective sheath (18) in order for a free end region of the substance (3) to be shifted into a free, projecting position, and also having a protective cap (4) for covering the free end region of the substance (3) in a not-in-use state. In order for a device of the type in question to be improved further, in particular in respect of device handling, it is proposed that the protective sheath (18) and the protective cap (4) should be accommodated in a casing part (5) and the protective cap (4) and the protective sheath (18) should be displaceable in a displacement direction (r) in the casing part (5), that the casing part (5) should have through-passage openings (6 and 7) at its opposite ends, as seen in the displacement direction (r), and in that the protective cap (4) should be connected to the casing part (5) such that it is movable in the displacement direction (r), but is captive.
