Abstract (en)
[origin: WO2018041408A1] The invention relates to a system and to a method for sensing the position of an object, in particular a vehicle, characterized in that the system comprises the object, a camera connected to the object, and a two-dimensional optically readable code, in particular QR code, wherein the two-dimensional optically readable code is at a distance from the object, wherein the camera is designed to sense the two-dimensional optically readable code, wherein the spatial position of the two-dimensional optically readable code is known, in particular in a world coordinate system.
