Abstract (en)

[origin: WO2018046731A1] The invention relates to a sliding window for a building, which comprises a frame (4), an opening member (3a) and a motorised drive device (5). The device (5) comprises an electromechanical actuator (6), a flexible element (9) and a pulley (19) for winding the flexible element (9). The pulley (19) is rotated by an output shaft (8) of the actuator (6). One end of a first strand (9a) of the flexible element (9) is connected to a first portion of the pulley (19). One end of a second strand (9b) of the flexible element (9) is connected to a second portion of the pulley (19). The pulley (19) and the output shaft (8) have the same axis of rotation. The device (5) also comprises a first angle transmission mechanism (20) engaging with the first strand (9a), so as to guide the first strand (9a) relative to the first portion of the pulley (19), and a second angle transmission mechanism (21) engaging with the second strand, so as to guide the second strand relative to the second portion of the pulley (19).
