Abstract (en)
[origin: WO2018050665A1] The invention relates to a device for detecting the properties of a subsurface, in particular a soil sensor, comprising at least one transmitter coil and at least one, preferably four, receiving coils, wherein the transmitter coil is designed to generate an electromagnetic primary field and the receiving coil is designed to receive the electromagnetic secondary field induced by the primary field in the subsurface, wherein the transmitter coil and the receiver coil are arranged in a front weight (1) for an agricultural work machine. The invention further relates to an agricultural work machine having such a device and to a method for operating such an agricultural work machine.
