Abstract (en)

[origin: WO2018050470A1] The invention relates to a method for monitoring an elevator system (10), wherein measured values are recorded in an elevator cabin (11) by a mobile end device (24) having at least one sensor (25). The mobile end device (24) is in particular carried by a passenger (23) of the elevator system (10). The recorded measured values are transferred from the mobile end device (24) to a central evaluation unit (32), which evaluates said values. The mobile end device (24) activates a measurement mode when the mobile end device detects that the mobile end device is in the region of a shaft door (18a) of the elevator system (10).
