Abstract (en)  
[origin: WO2018054653A1] The invention relates to a combination of leaf/sash frame (5) and casing frame (4) of a window/door having a rebate clearance region (6) situated between the rebates (2, 3) and having a fitting arranged on the leaf/sash frame (5) or on the casing frame (4) and intended for locking the leaf/sash in the frame. In order to provide a combination of leaf/sash frame (5) and casing frame (4) which, in the event of a break-in, actively counteracts a displacement of the leaf/sash frame relative to the casing frame and does not adversely affect the actual everyday function of a locking fitting and remains independent thereof, there is provision that at least one assembly (1) is provided in the rebate clearance region (6) between leaf/sash frame (5) and casing frame (4), which assembly, as a result of a displacement of the leaf/sash frame (5) and an increase of the rebate clearance region (6) in its active extent (35) between the rebates (2, 3), automatically adapts to the spacing of the latter.
