Abstract (en)
A radio terminal according to an embodiment is a radio terminal for a mobile communication system. The radio terminal includes: a receiver configured to receive first system information which is broadcast from a base station and includes information necessary for accessing a cell of the base station; and a controller configured to acquire, from the base station, second system information including system information other than the first system information. The controller is configured to acquire area information, which indicates an area in which the radio terminal can apply the second system information, together with the second system information from the base station.
