Abstract (en)

[origin: WO2018060322A1] The invention relates to a rotational connection (10) between parts (11, 12) that can be rotated with one another, including a shaft (11), a rotor (12), at least one clamping sleeve (13; 13'; 13'') clamped between the shaft (11) and the rotor (12) for transmitting torques between the shaft (11) and the rotor (12), in particular from the shaft (11) to the rotor (12). The clamping sleeve (13; 13'; 13'') releases a radial gap (16) between the shaft (11) and the rotor (12) with rotation in at least one speed range, in at least one, preferably in every sectional plane perpendicular to an axis of rotation (R) of the shaft (11) and the rotor (12). The rotor (12) is retained on the shaft (11) exclusively by the clamping sleeve (13; 13'; 13''). The invention also relates to a method for operating a rotational connection (10) of this type, a clamping sleeve (13; 13'; 13'') for a rotational connection (10) of this type, and a method for producing a rotational connection (10) of this type.
