Abstract (en)  
A power converter (10) may include a first (6a, 6c) and second housings (6b, 6d), each of which houses switching elements (41a - 41c) connected in parallel. Each of the first and the second housings may be provided with a first surface (421) and a second surface (422). The first and the second housings may be arranged face to face. In each of the first and the second housings, the switching elements (41a - 41c) may be aligned in an alignment direction which is parallel to both of the first and the second surfaces. An emitter terminal or a source terminal (6n) of parallel connection of the switching elements (41a - 41c) may extend from the second surface (422) at a position equidistant from the switching elements (41a, 41c) positioned at both ends in the alignment direction among the plurality of switching elements (41a - 41c). A collector terminal or a drain terminal (6p) of the parallel connection may be positioned adjacent to the emitter or the source terminal (6n) in the alignment direction.
