Abstract (en)  
[origin: WO2018087025A1] The invention relates to a support arrangement for a body of a vehicle, in particular a rail vehicle, wherein the body has at least one underframe (1), at least one first side wall (5) and a second side wall, and at least one roof (2). In order to provide advantageous structural conditions, it is proposed that at least one first support (10) and a second support (11) are provided, the at least first support (10) and the second support (11) are arranged displaceably with respect to each other, and this displaceability is blocked by at least one connection between the at least first support (10) and the second support (11). The two-part design of the support arrangement results in simplifications in the process of manufacturing the body, in particular during joining operations of the first side wall (5) and the second side wall to the underframe (1) and/or to the roof (2).
