Abstract (en)

[origin: WO2018092168A1] The invention relates to a drying rack (1) of the ventilated type comprising four hanging tiers (2, 2a, 2b, 2c, 2d) placed, two by two, on top of each other, a fan (10) for generating an air flow and a pair of pipes (11, 12) by means of which said air flow may be conveyed towards each of the hanging tiers. The drying rack (1) further comprises an electrical resistance (19) heatable by Joule effect, interposed between the fan (10) and the aforesaid pipes (11, 12). The resistance (19) intercepts the air flow generated by the fan (10) and, if fed, heats said air flow by forced convection. The pipes (11, 12) comprise, for each hanging tier, a mouth (14, 15, 17, 18) at which the air flow, exiting the pipe (11, 12), may be directed towards the tier. In particular, the exit of the air flow from the pipe (11, 12) occurs by means of a plurality of windows (22) which may be at least partially blocked by means of doors (23) which are shiftable in a controlled manner by a user of the drying rack (1). Said doors (23) allow to ventilate the hanging tiers (2, 2a, 2b, 2c, 2d) autonomously from one another.
