Abstract (en)

[origin: EP3524340A1] The invention relates to the field of producing lubricant materials, and specifically to a device for initiating cavitation and bringing about the process of cold blending of base oils and additives to produce lubricant materials, namely commercial oils and cutting fluids (CF). The technical result of the invention is that of increasing the uniformity of homogenization, increasing dispersion, and reducing energy consumption during the blending of base oils and various additive packages. A module for cold blending of lubricant materials and cutting fluids comprises a housing, an assembly for introducing components being blended, and an assembly for withdrawing components being blended, wherein at least two entirely metal blocks containing cylindrical and planar through-channels are sequentially arranged in the housing, and the active blending zone is situated between adjacent blocks.
