Abstract (en)  
[origin: EP3524761A1] Hinging structure for windows/doors/shutters, which comprises a first hollow metal profile (100) and a second hollow metal profile (200) respectively provided with a first appendage (105) projecting from a first hinging face (103) and with a first depression (205) receding from the second internal face (201) towards the second hinging face (203). A hidden hinge (300) is also present for rotatably connecting the two hollow metal profiles (100, 200) between a closed position (A), in which the first appendage (105) of the first hollow metal profile (100) is opposite the first depression (205) of the second hollow metal profile (200), delimiting with the second hollow metal profile (200) a first slit (305), and at least one open position (B), in which the hinging faces (103, 203) of the two hollow metal profiles (100, 200) do not face each other. The hidden hinge (300) comprises a first hinge body (2) and a second hinge body (3) mechanically fixed respectively to the first and to the second hinging face (103, 203) of the relative first and second hollow metal profile (100, 200) with the second hinge body (3) which is at least partially embedded within the second cavity (C2) of the second metal profile (200). The hidden hinge (300) also comprises articulation means (4), which rotatably connect the first hinge body (2) and the second hinge body (3) around a hinging axis (Y") parallel to the extension directions (Y, Y') of the two hollow metal profiles (100, 200) and contained within the second cavity (C2) of the second hollow metal profile (200) when the hidden hinge (300) is in closed position (A).
